

Anycolour Lightbox System a SIEL Success

The Anycolour Lightbox System from Anytronics is a modular system for coloured light wall construction, and it is particularly noteworthy for its range of colours that includes a full range of attractive pastel shades. Low energy use, low temperature and low maintenance components are used throughout and the digitally controlled RGBY colour mixing provides for complete colour control. It is ideal for use in retail, exhibition, architectural, TV and film applications.

Simple 'plug and play' connection uses plug and socket leads throughout and total colour control is available directly from ColourDesk products or via DMX. There is single colour wash, colour cycling and dynamic Anycolour colour wave capability and an optional built-in programmable controller with eight preset colour cycles. Digital HF ballasts give an average lamp and filter life expectancy of 20,000 hours. A full range of supporting controllers and other compatible lighting products is available.
